## CHAPTER V

NUMERICAL EXAMPLES

## NUMERICAL EXAMPLES

In this chapter we will give numerical examples of each type of computation i.e. loxodromic and orthodromic route computations, traverse tables, plotting and computing of the geographical position. An example of position computation with the HO249 tables is included.

The instrumental errors, which are the chronometer error $\boldsymbol{c}$, the sextant error $\boldsymbol{i}$, the height of the boat in order to find the "dip" correction are given, because they are specific to each instrument and ship

## The Nories tables

The computations are performed by the means of "Nories tables". The ability to use the tables is imperative in order remain independent from electronic devices. Pocket calculators give the same result, possible differences are due to rounding. The Nories tables remain forever valid and are available at any ship-chandler.

## Logarithms in Nories tables

In Nories tables logarithms are given the following:
$\log 0,5=\mathbf{1}, 69897$ instead of $\log 0,5=-0,30103$, where $\mathbf{1}, 69897=-1+1-0,30103$
this kind of shape is meant to eliminate subtractions on decimals.

## Example:

## The Nautical Almanac

In the nautical almanac the coordinates $\delta$, GHA or SHA of sun, moon, planets and stars are tabulated on a daily base. This book is only valid for one year and is sold by any shipchandler.

## The HO249 tables

This almanac gives the coordinates of the stars including their hc and Zn in function of the latitude. These tables remain forever valid at the exception of yearly correction page. The tables are freely available and downloadable on the site of the National Imagery Agency (NIMA).

## PROBLEM 1

On the first of October 2001 a boat is steering a course of $212^{\circ}$ at a speed of 5 knots. Her estimated position at 9 am deck time is $35^{\circ} 19^{\prime} \mathrm{N} ; 15^{\circ} 17,2 \mathrm{~W}$.

For measurements the sextant was hold by a man of $1,7 \mathrm{~m}$ tall and 32 years old on a deck at $1,3 \mathrm{~m}$ above the waterline. The chronometer is running 5 s too fast. The deck time is directly derived from the chronometer time. Regrettably the sextant has an index error of +2 minutes.

The following altitudes of the sun were noted at the respective deck times:

| O9h02m06s | $34^{\circ} 35,0^{\prime}$ |
| :--- | :--- |
| $10 h 03 m 15 s$ | $43^{\circ} 42,3^{\prime}$ |
| 11 hoom00s | $49^{\circ} 27,6^{\prime}$ |
| Meridional passage | $51^{\circ} 20,8^{\prime}$ |

Determine the position of the boat at meridional passage using the Nautical Almanac, the Nories tables. Use your pencil, parallel rulers and a pair of compasses. Don't use your pocket calculator please, except for verification.

## Solution :

$1^{\circ}$ summarise the data
$2^{\circ}$ compute the track with the traverse tables from Nories.
$3^{\circ}$ determine the basic parameters LHA and $\delta$ for each position
$4^{\circ}$ compute heights, azimuths and intercepts of each position
$5^{\circ}$ Plot each position line from the final position.
$6^{\circ}$ Measure $\Delta 1$ and Dep on the plot and convert Dep to $\Delta \mathrm{g}$.
$7^{\circ}$ Apply $\Delta l$ and $\Delta g$ on the final position in order to obtain the real position.

## Summarised data

| DATE | Time Zone | Dip | Rv | speed | c | i | $\mathbf{l}_{\mathbf{1}}$ | $\mathbf{g}_{\mathbf{1}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $01 / 10 / 2001$ | GMT- 1 | 3 m | $180^{\circ}+32^{\circ}=212^{\circ}$ | 5 kn | -5 s | $+2^{\prime}$ | $35^{\circ} 19,0^{\prime} \mathrm{N}$ | $15^{\circ} 17,2^{\prime} \mathrm{W}$ |

| Observation at Local Time | Measured height |
| :--- | :--- |
| 09 h 02 m 06 s | $34^{\circ} 35,0^{\prime}$ |
| 10 h 03 m 15 s | $43^{\circ} 42,3^{\prime}$ |
| 11 h 00 m 00 s | $49^{\circ} 27,6^{\prime}$ |
| Meridional pass. $=+/-12 \mathrm{~h} 00$ | $51^{\circ} 20,8^{\prime}$ |

| Local Time | UTC | UTC + correction (-5s) |
| :--- | :--- | :--- |
| 09 h 02 m 06 s | 10 h 02 m 06 s | 10 h 02 m 01 s |
| 10 h 03 m 15 s | 11 h 03 m 15 s | 11 h 03 m 10 s |
| 11 h 00 m 00 s | 12 h 00 m 00 s | 11 h 59 m 55 s |

## Comments

According to the initial position the navigation zone is the Azores archipelago.
Its time zone is GMT-1. The time zones are tabulated in the Nautical Almanac.
We use the local time as deck time, this avoids time lags. For computations however we need to convert the deck time to UTC. and also to correct the chronometer error. The Dip is the sextant altitude i.e. $1,7+1,3=3 \mathrm{~m}$.

| Entrance in table |  |  |
| :---: | :---: | :---: |
| Distance | $\mathbf{R v}$ | $\mathbf{l m}$ |
| 5 M | $212^{\circ}$ | $35^{\circ}$ |

| Results from table |  |  |
| :---: | :---: | :---: |
| $\Delta \mathbf{l}$ | Dep | $\Delta \mathbf{g}$ |
| $4,2^{\prime}(-)$ | $2,6^{\prime}$ | $3,2^{\prime}(+)$ |

| Position | Latitude | Longitude | At Deck Time |
| :---: | :---: | :---: | :---: |
| P1 | $35^{\circ} 19,0^{\prime} \mathrm{N}$ | $15^{\circ} 17,2^{\prime} \mathrm{W}$ | 09 h 00 |
| P2 | $35^{\circ} 14,8^{\prime} \mathrm{N}$ | $15^{\circ} 20,4^{\prime} \mathrm{W}$ | 10 h 00 |
| P3 $^{\circ}$ | $35^{\circ} 10,6^{\prime} \mathrm{N}$ | $15^{\circ} 23,7^{\prime} \mathrm{W}$ | 11 h 00 |
| P4 | $35^{\circ} 06,3^{\prime} \mathrm{N}$ | $15^{\circ} 26,9^{\prime} \mathrm{W}$ | 12 h 00 |

## Comments:

As our speed is 5 kn the distance covered each hour is 5 miles. We use the traverse tables because our distances are very short. We consider that each distance is then the hypotenuse of the plane right angled triangle with sides Dep and $\Delta \mathrm{l}$.
The traverse tables are nothing else than the tabulation of the formulas for right angled triangles:
$\Delta \mathrm{l} \quad=\quad($ dist $\times \cos R \mathrm{v}) \quad(\Delta \mathrm{l}$ is a distance and an angle $)$
Dep $=($ dist $x \sin R v) \quad$ (Dep is a distance but not an angle)
$\Delta \mathrm{g}=\mathrm{Dep} / \cos \operatorname{lm} \quad(\Delta \mathrm{g}$ is not a distance but an angle, $\operatorname{lm}$ is the main latitude $)$

We see on the figure that the latitude is decreasing and the longitude increasing.

## Determine the basic parameters

| GHA $\odot$ | Increments | GHA $\odot$ | UTC |
| :---: | :---: | :---: | :---: |
| $332^{\circ} 35,2^{\prime}$ | $30,3^{\prime}$ | $333^{\circ} 05,5^{\prime}$ | 10 h 02 m 01 s |
| $347^{\circ} 35,4^{\prime}$ | $47,5^{\prime}$ | $348^{\circ} 22,9^{\prime}$ | 11 h 03 m 10 s |
| $347^{\circ} 35,4^{\prime}$ | $14^{\circ} 58,8^{\prime}$ | $362^{\circ} 34,2^{\prime}$ | 11 h 59 m 55 s |

| $\mathbf{G H A} \odot$ | $\mathbf{g}(\mathbf{W})=-$ | LHA | UTC |
| :---: | :---: | :---: | :---: |
| $333^{\circ} 05,5^{\prime}$ | $15^{\circ} 17,2^{\prime}$ | $317^{\circ} 48,3^{\prime}$ | 10 h 02 m 01 s |
| $348^{\circ} 22,9^{\prime}$ | $15^{\circ} 20,4^{\prime}$ | $333^{\circ} 02,5^{\prime}$ | 11 h 03 m 10 s |
| $362^{\circ} 34,2^{\prime}$ | $15^{\circ} 23,7^{\prime}$ | $347^{\circ} 10,5^{\prime}$ | 11 h 59 m 55 s |

| $\delta$ | Increment d=1,0 | $\delta$ | UTC |
| :---: | :---: | :---: | :---: |
| $3^{\circ} 17,4^{\prime} \mathrm{S}$ | $0,0^{\prime}$ | $3^{\circ} 17,4^{\prime} \mathrm{S}$ | 10 h 02 m 01 s |
| $3^{\circ} 18,3^{\prime} \mathrm{S}$ | $0,1^{\prime}$ | $3^{\circ} 18,4^{\prime} \mathrm{S}$ | 11 h 03 m 10 s |
| $3^{\circ} 18,3^{\prime} \mathrm{S}$ | $1,0^{\prime}$ | $3^{\circ} 19,3^{\prime} \mathrm{S}$ | 11 h 59 m 55 s |

## The basic parameters

| $\mathbf{l}$ | $\delta$ | LHA |
| :---: | :---: | :---: |
| $35^{\circ} 19,0^{\prime} \mathrm{N}$ | $3^{\circ} 17,4^{\prime} \mathrm{S}$ | $317^{\circ} 48,5^{\prime}$ |
| $35^{\circ} 14,8^{\prime} \mathrm{N}$ | $3^{\circ} 18,4^{\prime} \mathrm{S}$ | $333^{\circ} 02,5^{\prime}$ |
| $35^{\circ} 10,6^{\prime} \mathrm{N}$ | $3^{\circ} 19,3^{\prime} \mathrm{S}$ | $347^{\circ} 10,8^{\prime}$ |

## Comments

The values GHA and $\delta$ are found in the nautical almanac.
In daily pages section we find the values GHA, $\delta$ for each entire hour. The d correction is found on the bottom of each daily page.

The yellow pages of the Nautical Almanac give the increments and corrections we have to add to the entire hour value.

Ex.: $\quad G H A$ at 11 h 00 m 00 s is $347^{\circ} 35,4^{\prime}$; the increment for 59 min 05 s is $14^{\circ} 58,8^{\prime}$
$\delta$ at 11 h 00 m 00 s is $3^{\circ} 18,3^{\prime} \mathrm{S}$ the increment for 59 min and $\mathrm{d}=1,0$ is $1,0^{\prime}$.
Note that $\delta$ is slow value that is incremented per minute and GHA a fast value that is incremented per second. Remember increments always have a positive sign and are always added.
The LHA $=G H A+g$, accordingly to the sign rule $g$ is negative because it is west.

## Computation scheme for $\mathrm{Hc}, \mathrm{Az}, \mathrm{Hv}$ and $\Delta \mathrm{H}$

The used formulas are the haversine formula in logarithmic shape and the ABC formulas. $\theta$ is only a auxiliary variable.

A shaded element is the algebraic sum of the elements above, except for element (*) All values are found in Nories tables.

| $\log \cos \quad$ l |  |
| :--- | :--- |
| $\log \cos \delta$ |  |
| $\log$ hav LHA |  |
| $\log$ hav $\theta$ |  |

| $l$ |  |
| :--- | :--- |
| $\delta$ |  |
| $1-\delta$ |  |
| hav $(1-\delta) \quad(*)$ |  |

| hav $\theta$ |  |
| :--- | :--- |
| hav(l- $\delta)$ |  |
| hav $\left(90^{\circ}-\mathrm{h}\right)=$ hav $\zeta$ |  |

| hc | $90^{\circ}-\zeta$ |  |
| :--- | :--- | :--- |

| $\mathbf{A}$ |  |
| :--- | :--- |
| $\mathbf{B}$ |  |
| $\mathbf{C}$ |  |
| $\mathbf{Z n}$ |  |

| hm |  |
| :---: | :--- |
| $\mathbf{i}$ |  |
| dip |  |
| $\mathbf{n}$ |  |
| hv |  |

| $\Delta \mathbf{h}$ | hc-hm |  |
| :--- | :--- | :--- |

All you have to do is to look up the values in Nories tables and eventually perform an interpolation. Then add them up

## First Position

| $\log \cos \quad 35^{\circ} 19,00^{\prime}$ | $\underline{\mathbf{1}}, 91167$ |

| $\mathbf{C}$ | $3,35 \mathrm{~S}$ |  |
| $\mathbf{Z n}$ | 20 SE | E because LHA $180<$ LHA $<360$ |

| $\mathbf{h m}$ | $49^{\circ} 27,6^{\prime}$ |
| :---: | ---: |
| $\mathbf{i}$ | $2,0^{\prime}$ |
| $\mathbf{d i p}$ | $-3,1^{\prime}$ |
| $\mathbf{n}$ | $15,2^{\prime}$ |
| $\mathbf{h v}$ | $49^{\circ} 41,7^{\prime}$ |

| $\Delta \mathbf{h}$ | hc-hm | $49^{\circ} 39,9^{\prime}-49^{\circ} 41,7^{\prime}=-1,8^{\prime}$ (to) |
| :--- | :--- | :--- |

Fourth position at Meridional passage

| Mer. Pass. | 11 h 50 m 00 s |
| :--- | ---: |
| $\varepsilon$ | 10 m 22 s |
| Culmination at $0^{\circ} \mathrm{W}$ | 12 h 00 m 22 s |
| Arc to time of $15^{\circ} 26,4 \mathrm{~W}$ | 01 h 01 m 46 s |
| Culmination time | 13 h 02 m 08 s |

| $\delta$ | $03^{\circ} 20,3^{\prime} \mathrm{S}$ |
| :--- | :--- |
| $\mathrm{d}=1,0$ | $0,0^{\prime}$ |
| $\delta$ | $03^{\circ} 20,3^{\prime} \mathrm{S}$ |
| l | $35^{\circ} 06,3^{\prime} \mathrm{N}$ |
| $\zeta=\|1-\delta\|$ | $38^{\circ} 26,6^{\prime}$ |
| $\mathrm{hc}=90^{\circ}-\zeta$ | $51^{\circ} 33,4^{\prime}$ |

| $\Delta \mathrm{h}$ | $\mathrm{hc}-\mathrm{hv}$ | $51^{\circ} 33,40^{\prime}-51^{\circ} 34,9^{\prime}=-1,5^{\prime}$ (to) |
| :--- | :--- | :--- |

## Plotting the position

The figure is not to scale
The correction to apply: $1,8 \mathrm{~S} ; 2,2 \mathrm{E}$
$35^{\circ} 06,3^{\prime}-1,8^{\prime}=35^{\circ} 4,5^{\prime}$
$15^{\circ} 26,9^{\prime}-2,2^{\prime}=15^{\circ} 24,7$
$35^{\circ} 04,5^{\prime} \mathrm{N}$
$15^{\circ} 24,7^{\prime}$ W

## Comment:

From the final position $\mathrm{P}_{4}$ draw a line for each obtained $\Delta \mathrm{h}$ and Zn at an angle Zn . Terminate it with an arrow. If $\Delta \mathrm{h}$ is "towards" then draw a perpendicular at a distance $\Delta \mathrm{h}$ in the direction of the arrow.

The scale you choose for $\Delta h$ is the scale with which you must measure Dep and $\Delta l$ on the plot.

## Example:

You draw a $\Delta \mathrm{h}$ of $2^{\prime}$ at a distance of 1 cm and then you measure a Dep of $0,9 \mathrm{~cm}$ and a $\Delta l$ of $1,2 \mathrm{~cm}$ then your Dep is $1,8^{\prime}$ and your $\Delta l$ is $2,4^{\prime}$.

## Construct $\Delta \mathrm{g}$

Construct a right angled triangle with base equal to Dep and angle lm, the hypotenuse then is $\Delta \mathrm{g}$.

This could also be done with the traverse tables however this is less accurate.

## PROBLEM 2

On the tenth of July 2001 a boat is steering a course of $60^{\circ}$ at a speed of 5 knots.
Her estimated position at 10 am deck time is $19^{\circ} 56^{\prime} \mathrm{S} ; 60^{\circ} 07,0^{\prime} \mathrm{E}$.
The sextant was hold at 3 m above the waterline. The chronometer is running 3 s too fast. The deck time is directly derived from the chronometer time. The sextant has an index error of -5 minutes.

The following altitudes of the sun were noted at the respective deck times :

| 10hoomoos | $37^{\circ} 53,1^{\prime}$ |
| :--- | :--- |
| 11hoom298 | $44^{\circ} 55,2^{\prime}$ |
| Meridionalpassage | $47^{\circ} 42,7^{\prime}$ |

Determine the position of the boat at meridional passage.

## Summarised data

| DATE | Time Zone | Dip | Rv | speed | c | $\mathbf{i}$ | $\mathbf{l}_{\mathbf{1}}$ | $\mathbf{g}_{\mathbf{1}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Plot

Position at Meridional passage :
The correction to apply: $7^{\prime} \mathrm{S} ; 10,9^{\prime} \mathrm{E}$

$$
\begin{aligned}
& 19^{\circ} 51,0^{\prime}+7,0^{\prime}=35^{\circ} 04,5^{\prime} \\
& 60^{\circ} 16,2^{\prime}+10,9^{\prime}=60^{\circ} 27,1^{\prime}
\end{aligned}
$$

## PROBLEM3

On 8 March 2001 a boat is steering a course of $70^{\circ}$ at a speed of 1,8 knots.
Her estimated position at 10 h 30 UTC is $35^{\circ} 18^{\prime} \mathrm{N} ; 15^{\circ} 15^{\circ} 07,0^{\prime} \mathrm{E}$. We assume that this estimated position is quite exact.

The sextant was hold at 3 m above the waterline. The chronometer is exactly matched on UTC. The sextant has no index error.

The following altitudes of the sun were noted at the UTC :

| 10h30m00s | $34^{\circ} 39,3^{\prime}$ |
| :--- | :--- |
| Cufmination height | $49^{\circ} 44,8^{\prime}$ |

Determine the position at culmination time with the Pagel method..

## Summarised data

| DATE | Time Zone | Dip | Rv | speed | c | $\mathbf{i}$ | $\mathbf{l}_{\mathbf{1}}$ | $\mathbf{g}_{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $8 / 03 / 2001$ | GMT | 3 m | $70^{\circ}$ | $1,8 \mathrm{kn}$ | 0 s | $0^{\prime}$ | $35^{\circ} 18,0^{\prime} \mathrm{N}$ | $15^{\circ} 15^{\prime} \mathrm{W}$ |

| Observation at UTC | Measured height |
| :--- | :--- |
| 10 h 30 m 00 s | $34^{\circ} 39,3^{\prime}$ |
| At $\pm 13 \mathrm{~h} 00$ | $49^{\circ} 44,8^{\prime}$ |

## Comment

According to the initial position the navigation zone is around Madeira which is keeping Greenwich Meantime. The Pagel method can be used only if the estimated position is quite close to the real position. These positions are considered as being close when their respective azimuths are nearly equal.

Basic parameters for estimated position Pe at 10h30

| $\Delta \mathbf{h}$ | hc-hm | $34^{\circ} 48,6^{\prime}-34^{\circ} 50,9^{\prime}=-2,3$ towards |
| :--- | :--- | :--- |

## Comment

This is a classic $\mathrm{Hc}, \mathrm{Zn}$ and $\Delta \mathrm{h}$ computation.

## Plot the position

On the plot we find Pa 1 and Pa 2

| Position | Latitude | Longitude | UTC |
| :---: | :---: | :---: | :---: |
| Pe | $35^{\circ} 18,0^{\prime} \mathrm{N}$ | $15^{\circ} 15,0^{\prime} \mathrm{W}$ | 10 h 30 m 00 s |
| Pa 1 | $35^{\circ} 18,0^{\prime} \mathrm{N}$ | $15^{\circ} 11,4^{\prime} \mathrm{W}$ | 10 h 30 m 00 s |
| Pa 2 | $35^{\circ} 19,5^{\prime} \mathrm{N}$ | $15^{\circ} 06,2^{\prime} \mathrm{W}$ | M.P. |

## The Pagel Method

Construct a middle latitude chart and plot the estimated position Pe . With the found Azimuth and intercept draw the fix of Pe. The adjusted Position Pa1 lays on the intersection between the parallel of Pe and its fix. The Position Pa 2 is obtained by transferring the fix over a distance of $4,5 \mathrm{nM}$ under $70^{\circ}$. (as the distance covered in 2,5 hours is : $1,8 \times 2,5=4,5$ ). All we do in fact is adapting the longitude of our estimated position to the longitude of Pa1. The intercept remains the same because we remain on the fix as the fix is the collection of points having the same intercept at that moment, but different Azimuths. However the change in Azimuth is a slow value.

## Culmination Height of Pa2

| Mer. Pass. | 12 h 11 m 00 s |
| :--- | ---: |
| $\varepsilon$ | 10 m 45 s |
| Culmination at $0^{\circ} \mathrm{W}$ | 12 h 00 m 15 s |
| Arc to time of $15^{\circ} 6,2^{\prime} \mathrm{W}$ | 1 h 00 m 24 s |
| Culmination time UTC | 13 h 00 m 39 s |

| $\delta$ | $-4^{\circ} 44,1^{\prime}$ |
| :--- | ---: |
| $\mathrm{d}=1,0$ | $0^{\prime}$ |
| $\delta$ | $4^{\circ} 44,1$ |
| $l$ | $35^{\circ} 19,5^{\prime}$ |
| $\zeta=\|l-\delta\|$ | $40^{\circ} 03,6^{\prime}$ |

| $\mathbf{h m}$ | $49^{\circ} 44,8^{\prime}$ |
| :---: | ---: |
| $\mathbf{i}$ | $0^{\prime}$ |
| $\mathbf{d i p}$ | $-3,1^{\prime}$ |
| $\mathbf{n}$ | $16,7^{\prime}$ |
| $\mathbf{h v}$ | $49^{\circ} 58,4^{\prime}$ |

| $\mathrm{hc}=90^{\circ}-\zeta$ | $49^{\circ} 56,4^{\prime}$ |
| :--- | :--- |

$\Delta \mathrm{h} \quad$ hc-hv $\quad 49^{\circ} 56,4^{\prime}-49^{\circ} 58,4^{\prime}=2,0^{\prime}$ towards

We find by computation that $\Delta \mathrm{l}=2^{\prime}$ towards and $\Delta \mathrm{g}=\Delta \mathrm{lx} \mathrm{C}=2 \times 0,92=1,88^{\prime}$
C is the parameter from in the ABC tables for Zn computation.
According to the plot $\Delta \mathrm{g}$ has to be applied westwards.
Which gives : $35^{\circ} 19,5^{\prime}-2,0^{\prime}=35^{\circ} 17,5^{\prime} \mathrm{N}$ and $15^{\circ} 4,2 \mathrm{~W}+1,88^{\prime}=15^{\circ} 6,1^{\prime}$

## $35^{\circ} 17,5^{\prime} \mathrm{N}$ <br> $15^{\circ} 04,2 W^{\prime}$

## Verification

| Position | Latitude | Longitude | UTC |
| :---: | :---: | :---: | :---: |
| Preal1 | $35^{\circ} 16,0^{\prime} \mathrm{N}$ | $15^{\circ} 13,3^{\prime} \mathrm{W}$ | 10 h 30 m 00 s |
| Preal2 | $35^{\circ} 17,5^{\prime} \mathrm{N}$ | $15^{\circ} 08,1^{\prime} \mathrm{W}$ | M.P. |

By running back Preal2 we find our real initial position Preal1 at 10h30. We can verify that Preal1 is laying on the fix of 10 h 30 .

The factor C : on the figure above is a detail of the plot we see that $\mathrm{Dep}=\Delta \mathrm{l} \times \operatorname{cotg} \mathrm{Zn}$ As $\Delta \mathrm{g}=\mathrm{Dep} \mathrm{x}$ sec l then $\Delta \mathrm{g}=\Delta \mathrm{l} \mathrm{x} \operatorname{cotg} \mathrm{Zn} \sec \mathrm{l}=\mathrm{Cx} \Delta \mathrm{l}$. As $\mathrm{C}=$ See definition of C in formularies.

| $\mathbf{2 1 7}^{\circ} \mathbf{2 0 , 5}{ }^{\prime}$ | $\mathbf{2 1 7}{ }^{\circ} 51, \mathbf{4}^{\prime}$ | $\mathbf{2 1 8}{ }^{\circ} \mathbf{3 4 ,} 0^{\prime}$ |
| g(E) $6^{\circ} 39,5^{\prime}$ | $6^{\circ} 08,6^{\prime}$ | $6^{\circ} 26,0^{\prime}$ |
| LHA $\gamma \quad 224{ }^{\circ}$ | $224{ }^{\circ}$ | $225{ }^{\circ}$ |

With LHA $\gamma$ as entry we find the HO249 table:

Correct the measured hights with dip and refraction coeff.

| $\mathrm{Hm}=30^{\circ} 40,6^{\prime}$ | $\mathrm{Hm}=65^{\circ} 19,5^{\prime}$ | $\mathrm{Hm}=50^{\circ} 31,6^{\prime}$ |
| ---: | :--- | :--- |
| $\mathrm{C} 1=-1,6^{\prime}$ | $\mathrm{C} 1=-0,4^{\prime}$ | $\mathrm{C} 1=-0,8^{\prime}$ | | Sextant heights |
| :--- |
| $\mathrm{C} 2=-3,0^{\prime}$ |
| $\mathrm{C} 2=-3,0^{\prime}$ |

Compute the intercepts

| Hv | $30^{\circ} 36,0^{\prime}$ | Hv | $65^{\circ} 19,5^{\prime}$ | Hv | $50^{\circ} 31,6^{\prime}$ |
| :--- | ---: | :--- | ---: | :--- | ---: |
| Hc | $30^{\circ} 34,0^{\prime}$ | Hc | $65^{\circ} 37,0^{\prime}$ | Hc | $50^{\circ} 25,0^{\prime}$ |
| $\Delta \mathbf{h 1}$ | $\mathbf{2 , 0}$ | $\Delta \mathbf{h 2}$ | $\mathbf{- 1 7 , 5}^{\prime}$ | $\Delta$ h3 | $\mathbf{6 0 , 6}^{\prime}$ |

## Plot

Plot respective fixes in the three estimated positions $6^{\circ} 39,5^{\prime} \mathrm{E}, 6^{\circ} 08,6^{\prime} \mathrm{E}, 6^{\circ} 26,0^{\prime} \mathrm{E}$ all at $42^{\circ} \mathrm{N}$

Transfer the position triangle over $2,2 \mathrm{M}$ at $301^{\circ}$ in order to correct the error due to nutation of the earth's axis.

CORRECTION FOR PRECESSION AND NUTATION
